--- TISSUB SPECIFICITY: Expressed in the poorly differentiated crypt cells of the small intestine as well as in the mature villous cells. Expressed at very low levels in the colon.
--- PTM: The goluble form (SDPP) derives from the membrane form (MDPP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      by proteolytic processing.
SIMILARITY: Belongs to the peptidase 89B family. DPPIV subfamily.
                                                                                                                                                                               N-GLYCOSYLATION SITES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CATALYTIC ACTIVITY: Release of an N-terminal dipeptide, Xaa-Yaa-|-Zaa-, from a polypeptide, preferentially when Yaa is Pro, provided Zaa is neither Pro nor hydroxyproline.
SUBUNIT: Homodimer.
SUBUNIT: Homodimer.
SUBCELLULAR LOCATION: Type II membrane protein. Also exists in a soluble form (By similarity).
TISSUE SPECIFICITY: Intestinal epithelium, dendritic cells and seeveral immune system tissues prof.
FYM: The soluble form (SDPP) derives from the membrane form (MDPP) by proteolytic processing (By similarity).
SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.

"Identification of the active site residues in dipeptidyl peptidase IV by affinity labeling and site-directed mutagenesis.";

Blochemistry 31:2582-2587(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  soluble form.
TISSUE SPECIFICITY: Expressed in bile ducts and other epithelial brush borders (small intestine, kidney, colon, pancreatic duct); acinar structures and alivary glands; endothelial structures and T cell areas in thymus, spleen and lymph node.

PTM: The soluble form (SDPP) derives from the membrane form (MDPP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               by proteolytic processing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hong W., Doyle D., $^{\rm Hong \ W.}$ and a signal/anchor sequence of {\rm ^{\rm Holecular}} dissection of the NH2-terminal signal/anchor

This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use as long as its content is in no way modified and this statement is not
-!- FUNCTION: Removes N-terminal dipeptides sequentially from polypeptides having unsubstituted N-termini provided that the polypeptides residue is proline.
-!- CATALYTIC ACTIVITY: Release of an N-terminal dipeptide, Xaa-Yaa-|-Zaa-, from a polypeptide, preferentially when Yaa is Pro, provided Zaa is neither Pro nor hydroxyproline.
                                                                                                                                                                                                                                                                                                                                                                                                                            PTM: The soluble form (SDPP) derives from the membrane form (MDPP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            by proteolytic processing. SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.
                                                                                                                                                                                                                                                                                      SUBUNIT: Homodimer.

INDUCTION: In fibroblasts at times and sites of tissue remodeling during development, tissue repair, and carcinogenesis.
PTM: N-glycosylated.
FTM: The N-terminus may be blocked.
SIMILARITY: Belongs to the peptidase S9B family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "..." NyAlternate names: GP110; membrane glycoprotein 110K; OX-61
NyContains: dipeptidyl-peptidase IV, soluble form
Cispecies: Rattus norvegicus (Norway rat)
Cjate: 10-Sep-1999 #sequence revision 10-Sep-1999 #text_change 09-Jul-2004
CjAccession: A39914; A33315; B33315; A60730; A42203; S38949; A31781

dipeptidyl-peptidae IV (EC 3.4.14.5) alpha chain - mouse
Nylterater names: CD26 alpha subunit; TRAM alpha subunit
C;Species; Nus muscrilus (house anouse)
